(54) Abstract Title

Online invention disclosure approval system

(57) A method of forming an online invention disclosure comprising entering information including first inventor identification information 102, storing the information in a central storage location and prompting approval of said first inventor 122. An approval log 126 may be generated which may comprise the step of recording the date of an approval. The forming of the disclosure may be performed by a non-inventor author. A second inventor may be identified, notified and prompted to approve the submission 124. The second inventor may revise the disclosure and then prompt the first inventor for approval by email. Various users may be allowed access to the information 132. There is also an online invention disclosure system comprising a user computer, a web server having an identification subsystem and a database coupled to the server where in order to gain access to a disclosure the user may enter a password associated with the disclosure. A directory system coupled to the server may be provided to store user information.

GB 2 368 674 A

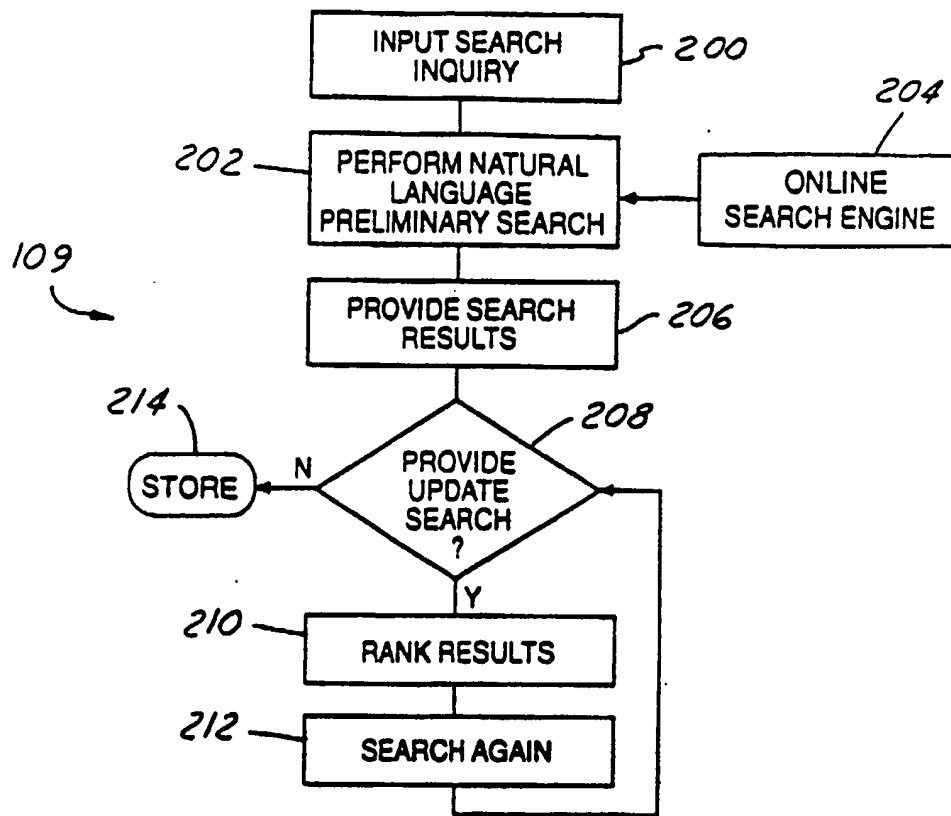

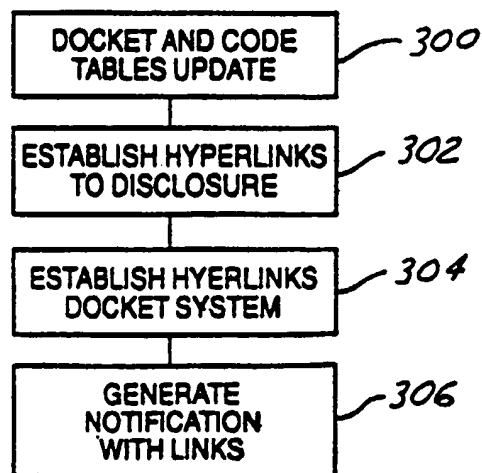

FIG. 1

**FIG. 3**

**FIG. 4****FIG. 5**

ON-LINE INVENTION DISCLOSURE APPROVAL SYSTEM

The present invention relates to an improved data
5 processing system, and more particularly, to an on-line
invention disclosure submission system.

In many companies, paper submission of forms such as
invention disclosures are routinely used. Commonly these
paper disclosures are mailed to a central location where
10 they are logged into a system and provided to a patent
coordinator or the corporate attorney. In large companies
having several offices, these invention disclosures are
mailed to the patent department or the patent coordinator.
The paper systems are burdensome on staff and the disclosure
15 documents may be subject to loss, misplacement or a
misrouting error.

Therefore, there is a need to provide a substantially
automated invention disclosure submissions process. Various
aspects of such a process may be found in U.S. Patents
20 5,247,661, 5,276,869, 5,317,683, and 5,377,355. These
patents all describe various aspects of a data processing
system. One drawback to this system described in these
patents is that it is an electronic mail (E-mail) based
system. Documents are transmitted back and forth between
25 various locations. The system requires client software on
individual user machines. This is particularly cumbersome
in a large corporate environment having multiple locations
in multiple countries. The drawback being that as migration
to new updated software packages is performed, the users in
30 all locations may not have the proper software to access the
system. Therefore, certain disclosures may not ever be made
due to the inconvenience. The prior patents also describe
that the documents are transmitted to each user's machine
for processing. Such a system, however, requires high
35 bandwidth to support the exchange of documents from the
central location to the user. Such a system, particularly
in large corporations, is impractical since large bandwidth

allocations for such a system are not desirable ways to use system resources.

It would therefore be desirable to provide an on-line invention disclosure system that does not require high
5 bandwidth for each user to have special software.

Corporate patent departments also typically maintain a docketing system. The docketing system keeps track of the disclosures as they are processed by the patent department. The docketing system maintains the status of disclosures for
10 the patent attorneys and patent coordinators and of any patent applications originating therefrom. Various due dates of the docket system are also tracked. Typically, inventors must call the patent department to determine the status of their invention disclosure because the docket
15 system is inaccessible to them. This process is also time consuming for staff. It would therefore be desirable to provide a system capable of automatically notifying and/or allowing inventors to access some or all of the information in a corporate docketing system so that the status may be
20 readily determined by the inventors.

Typically, invention disclosures are searched prior to preparing a patent application therefrom. Commonly, the disclosures are read and a computer or manual search is performed sometime after the disclosure is submitted. Also,
25 the inventors typically have little input to the process. It would also be desirable to perform a search during the invention disclosure submission process. Consequently, it would also be desirable to allow the inventor to participate or help direct the search.

30 In paper type systems and in the systems above, one inventor is responsible for preparing the invention disclosure document. It is presumed that concurrence has been achieved between the author of the invention disclosure and the other inventors. Oftentimes this is not achieved
35 and the invention disclosure is processed according to company policies without concurrence. It would therefore be desirable to provide an automated invention disclosure

system that does not allow the disclosure to be processed until concurrence has been reached by each of the inventors.

It is therefore one object of the invention to provide
5 an automated invention disclosure system that overcomes the drawbacks of prior known systems. The present invention provides a web based on-line invention disclosure system that may, for example, be used in cooperation with a corporate intranet.

10 In one aspect of the invention an on-line invention disclosure system includes a user computer and a web server having an identification subsystem. A database is coupled to the server. The server provides user screens to the user to prompt users to provide user information to the server.
15 The server receives disclosure information from the users and stores information in the database and prompts the users to provide a password. Upon the proper password, access to the disclosure is granted. Before granting a docket number, approval is received from each of the inventors.

20 In a further aspect of the invention, a method of forming an on-line invention disclosure comprises the steps of forming an invention disclosure online by entering a plurality of selected information including a first inventor identification information; as the plurality of selected
25 information is entered, storing the information in a central storage location; and prompting approval of said first inventor.

One advantage of the invention is that the system is platform independent. That is, PC, Mac or UNIX based
30 terminals may all access the web based on-line disclosure system. Another advantage of the present invention is that the document resides in one location and may be "viewed" by the inventors, the corporate patent staff, and evaluation committee members. The document itself does not actually
35 get transferred as in the E-mail based systems.

Another advantage of the invention is that inventors may access predetermined information from an on-line docketing system. Also, the docketing system may obtain invention information from the on-line docket system.

5 Another advantage of the invention is that evaluation committee members may automatically receive notices that invention disclosures are ready to be evaluated.

Other objects and features of the present invention will become apparent when viewed in light of the detailed
10 description of the preferred embodiment when taken in conjunction with the attached drawings and appended claims.

The invention will now be described further, by way of example, with reference to the accompanying drawings, in which:

15 Figure 1 is a high level block diagram of a disclosure system according to the present invention.

Figure 2 is a functional flow chart of a disclosure system according to the present invention.

Figure 3 is a flow chart of the operation of a
20 disclosure system according to the present invention.

Figure 4 is a flow chart of a search process according to the present invention.

Figure 5 is a flow chart of a docket system according to the present invention.

25 In the following figures the same reference numerals will be used to identify the same components in the various views. Various examples and parameters are set forth in the following description. These are meant to be by way of example and not meant to limit the scope of the invention.

30 The following example describes an on-line invention disclosure system. However, other types of collaborative authoring systems may utilize the same principles and concepts such as authoring technical and other papers.

Referring now to Figure 1, an on-line invention
35 disclosure system 10 is illustrated. On-line disclosure system 10 is a web based system having a web server 12 that is coupled to a plurality of users, one of which is shown as

user computer 14. The web server 12 as will be further described below may be coupled to a directory server 16 containing user information and to a database system 18. Database 18 may contain both docketing information and disclosure information. Although illustrated as one, database 18 may be comprised of two or more databases that are linked together. Various tables are established in database 18 and some of the information located in the docket tables may be linked with the disclosure tables as will be further described below.

Web server 12 has a file memory 20 that stores various files therein. Memory 20 is coupled to the Internet Information Server (IIS) 22. IIS 22 controls the operation of the system. IIS 22, for example, may have a lightweight directory access process (LDAP) 24, active server pages (ASP) 26, send mail transfer protocol (SMTP) 28, web single login (WSL) 30, and SAFile-up 32.

LDAP 24 is a protocol for accessing directory server 16. The LDAP 24 permits the retrieval of various user information from the directory server such as the employee's location, phone numbers, etc. in response to the entry of identification information. ASP 26 provides the scripts for the various pages that are viewed by the user. The scripts also control how the information is retrieved from the database 18 and how information is stored therein. Various scripts may be used for various situations in various companies. Preferably, the scripts prompt the user for a complete disclosure that may include a brief summary of the problem solved and a description of the present solution and how it solves the problem. Of course, numerous other categories of information may be prompted.

SMTP 18 provides the formatting for the company specific E-mail system. Various types of E-mail formatting would be evident to those skilled in the art. WSL 30 provides an identification subsystem whereby identification information such as the user's corporate ID and password are authenticated. A password may be established for each

disclosure during the initial entry into the system.
Thereafter, the password may be used to view the disclosure
and view the status thereof. SAFile-up 32 is a software
package provided by software artisans that allows the user's
5 PC to couple various documents to the invention disclosure.
LDAP 24 is coupled to directory server 16.

ASP 26 is coupled to COM 34. COM 34 are the objects
run on server 12. COM 34 is coupled to ADO 36 which is
coupled to Active X 38. ADO 36 and Active X are known types
10 of object formatting that allow the information to be
displayed in a convenient format. ADO 36 is coupled to ODBC
40, a known type of database driver. ODBC 40 is coupled to
docket system 18.

IIS 22 may also be coupled to a report server 42.
15 Report server 42 may be coupled to docket system 18. Report
server 42 provides printable reports to the various system
users.

IIS 22 may also be coupled to user computer 14 that has
a browser 44, a docket system program 46 that is coupled
20 through an ODBC 47 to docket system 18. Browser 44 may be
one of the many types of web browsers currently available
that is capable of communicating through the common http
protocol. The patent staff and patent coordinators may be
the only users with direct access to the docket database
25 through docket system program 46 and ODBC 47. Typical users
may obtain selected docket information from the docket
system through server 12 as will be described below.
Browser 44 may also be coupled to file viewers such as a CAD
file viewer 48. Some computer aided design (CAD) systems
30 may require an interface to operate with a web browser. CAD
file viewer 48 may be one of such systems typically employed
on these types of machines. Generally, as will be further
described below, the web server 12 retains the various
documents while user computers 14 may view selected portions
35 of the document without having to transmit the document back
and forth between various users.

Referring now to Figure 2, a block diagram of the process of the present invention is illustrated. As is described below, a user may be an inventor or just an author that enters the information in to the disclosure system 10.

5 User and inventor are used interchangeably because in most circumstances the user is an inventor but need not be. The author system allows company personnel to enter inventions by non-company personnel in the system. In block 50, the disclosure is prepared on-line. Passwords or other security

10 measures may be employed through the identification subsystem before access to the system may be gained. Preferably, a corporate directory service or other directory information may be used to assist the user in filling out the disclosure. For example, a get employee information

15 block 52 may be coupled to the prepare disclosure on line block 50 to provide the user information at the user's request in response to some identification information such as an E-mail ID, an employee number or the like. This employee user information thus becomes associated with the

20 particular disclosure being prepared. Block 50 may also allow the user to identify other co-inventors and request approval from co-inventors in block 54. The co-inventors of block 54 are preferably notified via an E-mail that the author has prepared an invention disclosure listing them as

25 a co-inventor and that they should either assist in drafting the disclosure or approve the final draft. For convenience, the e-mail notification may include a hyperlink so that the disclosure and a connection with the server may be obtained. In block 50, the inventor may be asked to fill in

30 predetermined disclosure information such as a brief description or comments, comment on prior art, give a brief description on the new technology provided by the invention, various invention dates, provide classification information such as company classification codes, and miscellaneous

35 other invention information such as whether a government contract was used or if the invention was disclosed to non-company personnel. The prepare disclosure on-line block 50

may also inquire whether other documents exist so that they may be attached to the disclosure as file attachments. The file attachments may be word processing documents, CAD files, presentation documents or various other types of documents.

When approval has been obtained from each co-inventor, the accept disclosure submission block 56 locks the document so no further changes can be made and obtains a docket ID number from a docketing system 58. The disclosure system makes the request and the docket system provides the next available docket number. The docket system in block 60 may also be linked to provide various other information from the on-line invention disclosure system 10.

In addition to accepting disclosures through an on-line system 56, provisions may also be made for accepting mail-in disclosures as was traditionally done. In this manner, the disclosures may be scanned into the system by the patent staff but are received from mail block 62.

Once the disclosure information has been finalized and accepted, block 64 may be performed wherein the disclosures may be ranked. An evaluator may receive an E-mail notice that a disclosure is available in his technology area. The disclosures may be ranked by a patent committee that looks at the priority ranking criteria and evaluates the disclosure accordingly. These details may vary depending on the company. The evaluation may be provided to the docket database in block 60.

Once ranked, the inventors may view the ranking in block 66. By logging on to the system through a web browser or other method, the inventors may monitor the invention disclosure through the process. Various inventors, co-inventors and patent committees in block 68 may be provided various information on the status of the disclosure. This may be done automatically as standardized letters generated by the server 12 or through an E-mail with a hyperlink to the disclosure or the status information. The ranking of

the disclosure may also be provided to inventors, co-inventors, and the attorneys responsible in block 70.

After ranking, the responsible attorney may evaluate the invention disclosure in block 72 for patentability.

5 Block 72 is coupled to block 66 so that the disclosure evaluation status may also be provided to inventors, co-inventors and patent committees in block 68. The evaluation of the disclosure may also be provided to the docket database 60. The evaluation of the disclosure in block 72
10 and the disclosure submission 56 may be provided to a supervisor, inventor or co-inventor by way of E-mail in block 74. The E-mails preferably contain hyperlinks so that the invention may be easily viewed by clicking on the hyperlink. Further details of the system are described
15 further below.

Referring now to Figure 3, the invention disclosure is prepared on-line in step 100. An author or inventor may prepare the invention disclosure. Preferably, the author or
20 inventor or both obtain access through a corporate Intranet or the Internet. In step 102, the user enters identification information (ID) for the system. This may also consist of a password or other security if this is a subsequent access to the system. The following, however, is
25 based upon an initial submission of an invention disclosure. In step 104, the information may be received from a central database or directory server maintained by the company. Various invention data is filled into the disclosure in step 106. As described above, the invention data is preferably
30 as detailed information as the inventor may provide. The invention data may be prompted from the on-line disclosure system through a series of direct questions and answers, or the user may be directed to various segments where broad questions are answered and the inventor may expound, or a
35 combination of both. In step 107, if any documents such as prints, flow charts, CAD files or other information would be helpful to the preparation of a patent application from the

disclosure, the documents may be attached so that they are stored in the system with the disclosure.

Optional steps 108 and 109 may also be performed. Step
5 108 classifies invention disclosure based on the information filled therein. Step 108 is further described below. In step 109, a search may be prompted using the various information from the system. The search may also interact with the inventor to determine whether the search is finding
10 appropriate information. The search step 109 also is further described below.

In step 110, the invention disclosure is submitted as a draft by the author. This draft submission is an approval
15 by the author/inventor. In step 122, the other inventors are notified to approve the invention disclosure. As mentioned above, the notification may be an E-mail with a hyperlink to the disclosure on the on-line system in a web based manner. In step 124, if all inventors do not approve
20 the disclosure then step 122 is executed again. If other inventors change the invention disclosure then approval for the changed draft should be obtained from all other inventors including the authoring inventor. When all the inventors approve the document, the document is locked to
25 prevent further changes. Preferably, an approval log becomes associated with the invention disclosure once all the inventors approve the invention disclosure in step 126. The approval log will demonstrate that each inventor reviewed and approved the same final version of the
30 disclosure. Approval in step 124 may also entail a variety of other functions including agreeing to an associated document such as an assignment of the invention, a power of attorney or other bookkeeping functions.

35 After approval, the disclosure becomes permanently and unchangeably (locked) part of the system by receiving a docket number assigned in step 128 so that tracking may be

provided. The docket number is obtained from the docket system. In step 130, all inventors are notified of the docket number. The inventors may view the status in step 132 of the invention. Preferably, notification takes place
5 by way of E-mail and may have a predetermined letter with a hyperlink therein. The hyperlink may be used to provide quick access to the system through the corporate Intranet or the Internet.

10 In step 133, an invention ranking committee or committees are notified to rank the invention disclosure. If a number of committees are used, the proper committee may be assigned by the corporate classification code entered by the inventor/author. The committee ranks the disclosure in
15 step 134. The system may also set an evaluation meeting of various committee members to rank the disclosure. To view the disclosure the committee members may click on a hyperlink from an E-mail or otherwise access the invention disclosure system. A ranking sheet or screen with various
20 ranking criteria may become associated with the disclosure. The committee ranking may be provided to the inventors through notification such as an E-mail or the disclosure may be accessed by the inventors from a previous notification.

25 In step 136, the invention disclosure may be automatically assigned to a member of the patent staff for evaluation based upon the corporate classification code. At all times the patent staff, the inventors and committee members preferably may access the system to obtain
30 information as to the status of the system.

Referring now to Figure 4, step 109 is illustrated in further detail. In step 109, an optional search function may be included with the on-line invention disclosure
35 system. The search is provided to give evaluators the state of the art to assist in their evaluation. A search inquiry is formulated in step 200. The search inquiry may be

manually entered or search terms may be derived from the disclosure itself. Boolean searching may be performed. Preferably, natural language searching may be performed from using selected sections of the invention disclosure that may
5 include a detailed description section or the problem/solution section. Also, the user may be prompted to enter search terms to be used in addition to the disclosure information. Various types of natural searching language engines may be used. Typically, these natural language
10 search engines rank the various terms of the search inquiries such as the portions of the invention disclosure and perform a search through various on-line search engines from various search vendors through a natural language search as shown in step 202. On-line search engines 204
15 provide the results of the search to the user. This preferably is a required step although the on-line disclosure system may make this step optional. The on-line search engine may include, for example, interfacing with the patent office website, or various other commercial searching
20 websites known to those skilled in the art. Many corporations subscribe to a commercial search service vendor. In step 204, the results of the search are provided to the inventor. The results may, for example, provide the top ten results from the search. In step 208, the inventor
25 may be prompted to provide a narrower search. In step 208 the search may be refined using the various terms received from the documents of the first search or previous searches and the search terms from the disclosure document. For example, various documents can be selected as being on point
30 and the wording from these documents may be weighted in addition to the prior search in step 210. Other documents that are not relevant may receive a negative weighting so that similar documents do not appear on the list of most relevant documents. The invention disclosure information
35 may then be repeatedly searched again in step 212 in view of the revised terms. Referring back to step 208, after the

search has been sufficiently refined, the results are stored together with the disclosure in step 214.

Referring now to Figure 5, the invention disclosure system may also be coupled to an on-line docket system. Various information may be shared between the docket system and the on-line invention disclosure system. For example, common information such as a date stamp may be provided as well as other information not limited to the title, the classification code, inventor name, an inventor acknowledgement and an assignment. This information may be provided to the docketing system in step 300. Upon approval, for example, the docketing system may provide a docket number to the disclosure system as mentioned above. In step 302, hyperlinks may be established to the disclosure for use by the various committees, the patent staff evaluator, and the inventors. This hyperlink may also require the establishment of a password to enter the system and access the particular disclosure. Preferably, each inventor only has access to their own disclosures. Patent committee members preferably have access to all disclosures that have been submitted by the various inventors whose area of technology (corporate classification code) is within that of the particular committee. Hyperlinks may be established to the docket system in step 304. Various notifications may be provided to the inventors and the patent committee members through E-mails or otherwise with various hyperlinks to the sites in step 306.

While particular embodiments of the invention have been shown and described, numerous variations alternate embodiments will occur to those skilled in the art. The example describes an on-line invention disclosure system. Other types of collaborative authoring systems may utilize the same principles and concepts such as authoring technical and other papers. Accordingly, it is intended that the invention be limited only in terms of the appended claims.

CLAIMS

1. A method of forming an online invention disclosure comprising:
 - 5 forming an invention disclosure online by entering a plurality of selected information including a first inventor identification information;
as the plurality of selected information is entered, storing the information in a central storage location; and
 - 10 prompting approval of said first inventor.
2. A method as recited in claim 1 further comprising the step of generating an approval log.
- 15 3. A method as recited in claim 2 wherein the step of generating an approval log comprises the step of recording the date of an approval.
4. A method as recited in claim 3 further comprising
- 20 associating the approval log with the disclosure.
5. A method as recited in claim 1 wherein the step of forming is performed by a non-inventor author.
- 25 6. A method as recited in claim 1 wherein the step of forming comprises the steps of identifying a second inventor; and,
further comprising the steps of notifying the second inventor; and,
- 30 prompting the second inventor to approve the submission.
7. A method as recited in claim 1 further comprising the step of revising the disclosure by the second inventor
- 35 to form a revised disclosure, prompting the first inventor to approve the revised disclosure.

8. A method as recited in claim 1 wherein the step of prompting the second inventor comprises providing an E-mail to the second inventor notifying comprising a hyperlink to the disclosure.

5

9. A method as recited in claim 1 wherein the step of prompting comprises the step of prompting the approval of an associated document.

10 10. A method as recited in claim 9 wherein said associated document is selected from a group consisting of an assignment document and a power of attorney.

11. A method as recited in claim 1 further comprising
15 the step of allowing access to various users for obtaining the information.

12. An invention disclosure system comprising:
a user computer;
20 a web server having an identification subsystem;
a database coupled to the server;
said server providing user screens to said users so
users provide disclosure information to said server,
receiving disclosure information from said users, storing
25 information in said database, prompting the user to provide
a password associated with said disclosure; and allowing
access to said disclosure after storing on said database
upon entering the password associated with the disclosure.

13. A system as recited in claim 12 further comprising
30 a directory system coupled to said server whereby upon
providing identification information to server said server
retrieves user information from the directory system in
response to the identification information.

35

14. A system as recited in claim 12 wherein said server creates a user log.

15. A system as recited in claim 14 wherein said server associates said approval log with said disclosure.

5 16. An invention disclosure system comprising:
a user computer;
a server;
a database coupled to the server;
said server providing user screens to said users to
10 prompt said users to provide disclosure information to said server, receiving disclosure information from said users including a first inventor identification and a second inventor identification, storing information in said database, prompting the first inventor and the second
15 inventor to provide an approval.

17. A system as recited in claim 16 wherein said server generated an approval log associated with said disclosure.

20

18. A system as recited in claim 17 wherein said server associates said approval log with said disclosure.

19. A system as recited in claim 16 further comprising
25 a directory system coupled to said server whereby upon providing identification information to server, said server retrieves user information from the directory system in response to the identification information.

30 20. A method of forming an online invention disclosure comprising:

forming an invention disclosure online by entering a plurality of selected information including a first inventor identification information and a second inventor
35 identification;

as the plurality of selected information is entered, storing the information in a central storage location;

prompting approval of said first inventor;
notifying the second inventor; and,
prompting the second inventor to approve the
disclosure; and

5 locking the disclosure to create a locked disclosure to
prevent further editing of the disclosure when the second
inventor approves the disclosure.

21. A method as recited in claim 20 further comprising
10 the step of generating an approval log.

22. A method as recited in claim 21 wherein the step
of generating an approval log comprises the step of
recording the date of an approval.

15

23. A method as recited in claim 22 further comprising
associating the approval log with the disclosure.
